Green Kitchens: Why?

“These days, designing living spaces in an environmentally friendly manner transcends politically correct. So it is incumbent upon the design community to do its part to create healthy atmospheres for our clients by using sustainable materials that do not add to the toxic wastes already in our atmosphere. The current and future well being of our people and our planet demand it!” said [Kitchen Brokers](#) owner [Chris Donaghy](#).

“Our goal is to provide living spaces, particularly for chemical sensitive individuals, that do not contain toxins and carcinogens like acetone, ammonia, crystal silica, and formaldehydes. By utilizing plantation grown woods like Lyptus, bamboo, and FHP certified woods, by specifying formaldehyde free wood products, and by using paints and finishes formulated from non toxic and natural chemicals and minerals, and by using energy star certified appliances, we are able to create a safe, healthy, and virtually green kitchen space. The trend toward building green is steadily building, and with costs now comparable to the old way, I expect my business to double in size in the next year. And as the movement grows, our way of doing business will become worldwide. It’s a win win situation for all.”
